THE GEOGRAPHIC AND SPECIALTY DISTRIBUTION OF PHYSICIANS
IN FLORIDA

PART I: PHYSICIAN CENSUS DATA

JUNE 1978

State Library of Florida

F610.92s
G345
1978
v. 1

3 1246 00475738 3

AA0016
BOR 78-6

This is the first of a two part series of studies designed to point up the physician needs of Florida.

In the past few years the increase in physicians licensed to practice in Florida has exceeded the relative growth in population by a wide margin. But there are many speciality practices in medicine and it is not enough to speak of total numbers of doctors without reference to type of practice.

There is a common belief that in many areas of the state there are now quite enough physicians of certain specialties. But how many is "enough"? This is the fundamental question to which this study is addressed.

An accurate count of the number of physicians in active practice by specialty is difficult to come by. A licensure list will contain many who are retired, partially retired or clinically inactive for other reasons. It will omit many of the interns and residents, most who practice in military hospitals (of which there are nine in Florida), and some of those who staff the five Veterans Administration hospitals and the several state institutions. These doctors, who are not required to have a Florida license, nevertheless provide a significant amount of care to Florida citizens who are counted in the population census.

Most, but by no means all, physicians are members of their state and county medical societies. Most of these rosters have been updated recently and they have been extensively consulted in the preparation of this document.

Another valuable resource has been the yellow pages of the various telephone books. But these listings generally omit the hospital based doctors, along with many of the strictly referral specialists.

After extensive cross references using these resources there were still some names on the licensure list that could not be verified. For clean-up of these lists the invaluable help of many friends and organizations in the local area, including local hospitals, is gratefully acknowledged. In spite of such intensive effort there remain a few licensed physicians in some of the larger counties that could not be verified. Hence these numbers may slightly underestimate the number of practicing physicians, but not to any significant extent. It still represents the best inventory available of the total number of active physicians, by specialty, in Florida.

3 1246 00122 5202

The data are presented by county but caution should be exercised in using the data this way. In many cases patients and doctors are oblivious to county boundaries, especially in those instances where a metropolitan area is located near a county line.

Although separate analyses were carried out of doctors of medicine (total: 15,013) and doctors of osteopathy (total: 731), they are combined for purposes of this report.

Specialties are, in the main, self described. No reference to Board status is intended. When a conflict of specialty was found, it was generally resolved in favor of the county medical society classification. No attempt was made to reconcile confusion between the use of the terms general practice and family practice.

Finally, an explanation is in order for the larger number of fractions. When it was determined that a physician maintains an office in two counties, he or she was listed as one-half in each. Likewise, if evidence was found of less than full time practice, one-half was used. No attempt was made to fractionate time further.

Part I is a presentation of data without analysis. There are many ways these data may be grouped to answer targeted questions. Part II of this project will incorporate some of these analyses and in particular will focus on the numbers of physicians of what type needed to meet the demands of patient populations for services.

K. E. Penrod
